To Whom It May Concern

System Sensor Detectors - Working Life Expectancy

System Sensor smoke detectors and heat detectors are designed and manufactured to provide at least ten (10) years of reliable service.

Please note that all commercial smoke and heat detectors contain electronic components which could potentially fail at any time. Therefore all smoke and heat detectors should be regularly inspected and functionally tested annually as per the requirements of the local regulatory requirements.

Any smoke detector, heat detector, or any component of a fire detection system which fails should be repaired or replaced immediately. In all cases System Sensor recommends the replacement of fire detectors after fifteen (15) years of operation.

If you have any questions in relation to System Sensor products, or their application, please contact System Sensor Technical Services, or visit our website: www.systemsensor.com

Yours faithfully,

Philip Bush
